

IN THE CLAIMS:

1. (Currently amended): A method of transmitting a message ~~through the internet~~ from a sender to a recipient through a server displaced from the recipient, including the steps of:

receiving the message at the server from the sender and receiving an indication at the server from the sender that the sender wishes to send the message in a manner special to the sender and not normally provided by the server,

transmitting, ~~through the internet~~ from the server to an agent of the recipient^{[[;]]} the message in the special manner, in accordance with the indication from the sender to the server, an identification and ~~an internet~~ address of the server and the identity of the sender,

receiving ~~from the agent~~ at the server ~~through the internet~~ from the agent the identity of the agent and an indication of the receipt of the message by the agent and the identification and ~~internet~~ address of the server and the identity of the sender, and

sending to the sender from the server ~~through the internet~~ a copy of the message and the information received by the server from the agent.

2. (Currently amended): A method as set forth in claim 1 wherein the transmission ~~through the internet~~ from the server to the agent of the recipient is in the normal manner when the sender does not provide an indication ~~through the internet to the server~~ that the sender wishes the server to transmit the message ~~through the internet~~ in the special manner to the agent of the recipient.

3. (Currently amended): A method as set forth in claim 1 wherein the indication received by the server ~~through the internet~~ from the agent of the recipient includes an identification of the agent and any transferring agents through whom the message has passed between the server and the agent of the recipient.

4. (Currently amended): A method as set forth in claim [[+]] [[3]], wherein
~~a digital fingerprint~~ an encrypted hash of the message is provided by the server to
the sender a plurality of digits in a unique sequence and is sent by the server to the sender with
the message after the indication is received by the server from the agent of the recipient.

5. (Currently amended): A method as set forth in claim 3 wherein
the transmission ~~through the internet~~ from the server to the agent of the recipient
is in the normal manner when the sender does not provide an indication to the server that the
sender wishes the server to transmit the message ~~through the internet~~ in the special manner to the
agent of the recipient and wherein
~~a digital fingerprint~~ an encrypted hash of the message is provided by the server to
the sender as a plurality of digits in a unique sequence and is sent by the server to the sender with
the message after the indication is received by the server from the agent of the recipient.

6. (Original) A method as set forth in claim 1 wherein
an additional indication is provided to the server with the message from the
sender that a high priority should be provided by the server to the sending of the message by the
server to the agent of the recipient and wherein
the server provides the high priority in sending the message to the agent of the
recipient in accordance with the additional indication.

7. (Original) A method as set forth in claim 5 wherein
an additional indication is provided to the server with the message from the
sender that a high priority should be provided by the server to the sending of the message by the
server to the agent of the recipient and wherein
the server provides the high priority in sending the message to the agent of the
recipient in accordance with the additional indication.

8. (Original) A method as set forth in claim 1 wherein
an additional indication is provided to the server with the message from the
sender that the sending of the message by the server to the agent of the recipient should be
recorded by the server and wherein
the server records the sending of the message by the server to the agent of the
recipient in accordance with the additional indication.

9. (Currently amended) A method as set forth in claim ~~[[5]]~~ ~~[[1]]~~ wherein
an additional indication is provided to the server with the message from the
sender that the sending of the message by the server to the agent of the recipient should be
recorded by the server and wherein
the server records the sending of the message to the agent of the recipient in
accordance with the additional indication.

10. (Currently amended): A method of transmitting a message ~~through the internet~~
from a sender to a
recipient through a server displaced from the recipient, including the steps at the server of:
receiving the message at the server from the sender,
receiving at the server, with the message from the sender, an indication that the
message is to be transmitted by the server in a special manner different from the manner
normally provided by the server in transmitting messages,
transmitting from the server ~~through the internet~~ to an agent of the recipient, in
the special manner indicated by the sender to the server, the message and an identification and an
~~internet~~ address of the server and an indication representing the identity of the sender,
receiving at the server from the agent a handshaking and delivery history of the
transmission of the message from the server to the agent of the recipient, and

transmitting from the server to the sender ~~through the Internet the message, a digital signature, including a digital fingerprint, the message and an encrypted hash~~ of the message and the handshaking and delivery history of the message received by the server from the agent of the recipient.

11. (Currently amended): A method as set forth in claim 10, including the steps of:
the indication from the server to the server being a first indication,
receiving at the server, with the message from the sender, an ~~additional~~
indication in addition to the first indication, from the server of an additional function to be performed in the transmission of the message from the server to the agent of the recipient,

providing the additional function in the transmission of the message from the server to the agent of the recipient in accordance with the additional indication provided by the sender to the server.

12. (Original) A method as set forth in claim 11 wherein
the message is sent by the server to the sender after the server receives from the agent of the recipient the handshaking and the delivery history of the transmission of the message from the server to the agent of the recipient and wherein
the server does not retain the message after it sends the message to the sender.

13. (Currently amended): A method as set forth in claim 11 wherein
the additional indication from the sender to the server provides for a recording of the transmission of the message and wherein

the transmission of the message is recorded in accordance with the additional indication from the sender to the server.

14. (Currently amended): A method as set forth in claim 11 wherein the additional indication from the sender to the server provides for an archiving of the message and wherein the message is archived in accordance with the additional indication from the sender to the server.

15. (Currently amended): A method as set forth in claim 11 wherein the additional indication from the sender to the server provides for the message to be sent by the server to the agent for the recipient by a special route and wherein the message is sent by the special route from the server to the agent of the recipient in accordance with the additional indication from the sender to the server.

16. (Currently amended): A method as set forth in claim 11 wherein the additional indication from the sender to the server provides for the message to be specially handled by the server in the transmission of the message from the server to the agent of the recipient and wherein the message is specially handled by the server in the transmission of the message from the server to the agent of the recipient.

17. (Currently amended): A method as set forth in claim 11 wherein the additional indication from the sender to the server provides for a transmission of the message with a high priority from the server to the agent of the recipient and wherein the message is transmitted from the server to the agent of the recipient with [[a]] [[the]] high priority in accordance with the additional indication from the sender to the server.

18. (Currently amended): A method as set forth in claim 11 wherein
the server ~~retains a copy of~~ destroys the message and the digital signature
encrypted hash of the message and the ~~handshaking and delivery history of the message, but not~~
~~the message unless requested to do so by the sender,~~ after the server transmits to the sender
~~through the internet the message, the digital signature~~ encrypted hash of the message and the
handshaking and delivery history of the message.

19. (Currently amended): A method as set forth in claim 10 wherein
~~the server retains a copy, except for the message, of the information received by~~
~~the server from the agent of the recipient and sent to the sender and wherein~~
the server destroys the message and the encrypted hash of the message after it
transmits the message and the encrypted hash of the message to the sender and wherein

when the sender wishes to authenticate that the message was sent by the server to
the agent of the recipient, the sender sends to the server the message and the encrypted hash of
the message and wherein

the server operates upon the message and the encrypted hash of the message to
authenticate the message
~~server matches the information, except for the message, sent by the server to the sender relating~~
~~to the message with the information retained by the server relating to the message.~~

20. (Currently amended): A method as set forth in claim 10 wherein
the server requests a delivery status notification from the agent of the recipient
relating to the message when it transmits the message to the agent and wherein
the server receives the delivery status notification from the agent of the recipient
when it receives the ~~digital signature of the~~ message from the agent.

21. (Currently amended): In a method of transmitting a message through the internet to a recipient through a server displaced from the recipient, the steps at the server of:

receiving the message at the server from the sender,

generating a hash constituting a synopsis of the message in coded form,

encrypting the hash with a particular encryption code to generate an encrypted hash ~~a digital fingerprint~~ of the message,

receiving from the sender at the server an indication with the message from the sender that the message is to be handled by the server in a particular manner different from a normal handling of the message by the server, and

handling the message at the server in the particular manner, in accordance with the indication from the sender to the server ~~to transmit the message and the digital fingerprint to the recipient.~~

22. (Currently amended): In a method as set forth in claim 21, the steps of:

generating at the server, for any attachment to the message, an encrypted hash ~~a hash constituting a synopsis of the attachment in coded form,~~

~~encrypting the hash from the attachment with a particular encryption code to generate a digital fingerprint of the attachment, and~~

transmitting at the server the attachment and the digital fingerprint encrypted hash of the attachment to the sender ~~through the internet~~ at the same time, and in the same manner, that the message and the digital fingerprint encrypted hash of the message are transmitted ~~from~~ [[at]] the server to the sender ~~through the internet.~~

23. (Currently amended): In a method as set forth in claim ~~[[21]]~~ [[22]] wherein

the message is handled by the server in the normal manner when the indication is not provided by the sender to the server with the message and wherein

the message is handled by the server in the particular manner when the indication is provided by the sender to the server with the message.

24. (Original) In a method as set forth in claim 23 wherein
the message is processed by the server in a first path when the indication is not provided by the sender to the server with the message and wherein
the message is processed by the server in a second path different from the first path when the indication is provided by the sender to the server with the message.

25. (Currently amended): In a method as set forth in claim ~~[[25]]~~ [[21]], the steps of:
storing at the server the ~~digital fingerprint~~ encrypted hash of the message, the name of the sender, the identity and ~~internet~~ address of the server and the identity and ~~internet~~ address of the recipient, and
transmitting to the sender for storage by the sender the message, the ~~digital fingerprint~~ encrypted hash of the message, the name of the sender, the identity and ~~internet~~ address of the server and the identity and ~~internet~~ address of the recipient.

26. (Currently amended): In a message as set forth in claim 22 wherein ~~[[7]]~~
~~the message is handled by the server in the normal manner when the indication is not provided by the sender to the server with the message and wherein~~
~~the message is handled by the server in the particular manner when the indication is provided by the sender to the server with the message and wherein~~
the message is ~~processed~~ transmitted by the server in a first path to the agent of the recipient when the indication is not provided by the sender to the server with the message and wherein
the message is processed by the server in a second path different from the first path when the indication is provided by the sender to the server with the message and wherein

the ~~digital fingerprint~~ encrypted hash of the message, the name of the sender, the identity and ~~internet~~ address of the server and the identity and ~~internet~~ address of the recipient are stored at the server, and wherein

the message, the ~~digital fingerprint~~ encrypted hash of the message, the name of the sender, the identity and ~~internet~~ address of the server and the identity and ~~internet~~ address of the recipient are transmitted by the server to the sender for storage by the sender.

27. (Currently amended): A method of transmitting a message ~~through the internet~~ from a sender to an agent for a recipient through a server displaced from the agent including the steps of:

providing the message from the sender at the server,

providing at the server an encrypted hash of the message and the identify of the sender and the identity and address of the server,

~~providing at the server a digital fingerprint of the message and the identity of the sender and the identity and internet address of the server,~~

~~an encrypted hash~~

normally transmitting from the server to the agent in a first route the message and the identity of the sender and the identity and ~~internet~~ address of the server,

providing an indication at the server from the sender that the message from the sender should be transmitted by the server to the ~~sender~~ agent of the recipient ~~through~~ through ~~[[in]]~~ a second route different from the first route,

transmitting the message from the server to the agent of the recipient through the second route in accordance with the indication provided to the server from the sender,

providing at the agent of the recipient an indication of the status of the reception at the agent of the transmittal from the server to the agent of the message and the identity of the sender and the identity and the ~~internet~~ address of the server, and

transmitting to the server from the agent of the recipient the identity and ~~internet~~ address of the ~~gent~~ [[agent]] and the status of the reception at the agent of the message and the identity of the sender and the identity and ~~internet~~ address of the server.

28. (Currently amended): A method as set forth in claim 27 wherein
the ~~digital fingerprint~~ encrypted hash of the message includes a ~~digital digest~~ hash of the message and an encryption of the ~~digital digest~~ hash and wherein
the message and the ~~digital fingerprint~~ encrypted hash of the message and the identity of the sender and the identity and ~~internet~~ address of the server and the identity and the ~~internet~~ address of the agent of the recipient and the status at the agent of the reception at the agent of the message are transmitted by the server to the sender.

29. (Currently amended): A method as set forth in claim 27 wherein
the sender provides at the server for an indication of an additional function to be ~~performed~~ performed at the server and wherein
the server performs the additional function in accordance with the indication from the ~~sender~~ server.

30. (Currently amended): A method as set forth in claim 29 wherein
the additional indication at the server provides for the message to be specially handled in the transmission of the message from the server to the agent of the recipient and wherein
the message is specially handled in the transmission of the message from the server to the agent of the recipient.

31. (Currently amended): A method set forth in claim 28 wherein the sender provides at the server for an indication of an additional function to be performed at the server and wherein

the additional function represented by the additional indication provides for the message to be specially handled in the transmission of the message from the server through the second route to the agent of the recipient and wherein

the message is specially ~~handled~~ handled in the transmission of the message from the server through the second route to the agent of the recipient.

32. (Currently amended): A method of transmitting a message ~~through the internet~~ from a sender to an agent for a recipient through a server displaced from the agent, including the steps at the server of:

providing at the server ~~a digital fingerprint~~ an encrypted hash of the message and the identity of the sender and the identity and the ~~internet~~ address of the server,

normally transmitting to the agent of the recipient through a first ~~route~~ path from the server the message and the identity of the sender and the identity and ~~internet~~ address of the server,

receiving at the server from the sender an indication that the message should be sent by the server to the agent of the recipient through a second path different from the first path,

transmitting at the server to the agent of the recipient the message and the identity of the sender and the identity and ~~internet~~ address of the server through the second path different from the first path in accordance with the indication from the sender to the server,

receiving at the server from the agent of the recipient an indication of the identity of the sender and the identity and ~~internet~~ address of the server and the identity and ~~internet~~ address of the agent and an indication of the status of the reception of the message at the agent, and

transmitting to the sender from the server the message and the encrypted hash of the message and the information received by the server from the agent of the recipient relating to the message.

33. (Currently amended): A method as set forth in claim 32 wherein
~~the server stores the information relating to the message, but not the message,~~
~~transmitted by the server to the sender~~ the server destroys the message and the encrypted hash of the message after the server transmits the message and the encrypted hash of the message to the sender and wherein

the server produces hashes from the message and the encrypted hash and wherein

~~the server authenticates the message by comparing the information stored by the server relating to the message with the information transmitted from the server to the sender relating to the message~~ hashes to determine if they are identical.

34. (Original) A method as set forth in claim 32 wherein
the server receives additional information from the sender relating to additional functions to be performed by the server on the message in the transmission of the message from the server to the agent of the recipient and wherein

the server performs the additional functions on the message, in accordance with the additional information received by the server from the sender, in the transmission of the message from the server to the agent of the recipient.

35. (Original) A method as set forth in claim 34 wherein
the indication received by the server from the sender constitutes a first coding of the message from the sender and wherein

the additional information received by the server from the sender of the additional function to be performed by the server constitutes a second coding, added to the first coding, of the message from the sender.

36. (Original) A method set forth in claim 33 wherein

the server receives additional information from the sender relating to additional functions to be performed by the server on the message in the transmission of the message from the server to the agent of the recipient and wherein

the server performs the additional functions on the message, in accordance with the additional information received by the server from the sender, in the transmission of the message from the server to the agent of the recipient and wherein

the indication received by the server from the sender constitutes a first coding of the message from the sender and wherein

the additional information received by the server from the sender of the additional function to be performed by the server constitutes a second coding, added to the first coding, of the message from the sender.

PLEASE ADD THE FOLLOWING CLAIMS:

37. (New) A method as set forth in claim 36 wherein

the sender transmits the message and the encrypted hash of the message to the server when the sender wishes to have the message authenticated and wherein

the server operates upon the message and the encrypted hash of the message to have the message authenticated.

38. (New) A method as set forth in claim 37 wherein
the server provides a first hash of the message and decrypts the encrypted hash to
provide a second hash of the message and compares the first and second hashes to authenticate
the message.

39. (New) A method as set forth in claim 26 wherein
the message and the encrypted hash of the message are destroyed by the server
after the message and the encrypted hash are transmitted by the server to the sender.

40. (New) A method as set forth in claim 39 wherein
the sender transmits the message and the encrypted hash of the message to the
server when the sender wishes to have the message authenticated and wherein
the server processes the message and the encrypted hash of the message to
authenticate the message.

41. (New) A method as set forth in claim 40 wherein
the processing of the message and the encrypted hash of the message includes the
steps of creating a hash of the message and decrypting the encrypted hash to create a second hash
and comparing the hashes to determine if they are identical.
